ACKNOWLEDGEMENT

I would like to express my sincere gratitude to all those who helped and supported me during the completion of this project titled “**Medical Store Management Software.**” This project would not have been possible without the valuable guidance and encouragement of many individuals.

First, I would like to thank my project guide and teachers for providing their constant support, guidance, and motivation throughout the development of this project. Their suggestions and valuable advice helped me to understand the concepts clearly and complete the project successfully.

I would also like to express my gratitude to our college for giving me the opportunity to work on this project as part of my academic curriculum. This project helped me gain practical knowledge and experience in software development and database management.

I would like to thank my friends and classmates for their cooperation and support during the development of the project. Their help in solving problems and sharing ideas was very valuable.

Finally, I would like to thank my family members for their continuous encouragement and support throughout my studies and during the completion of this project.

INTRODUCTION

The **Medical Store Management Software** is a computerized system designed to manage the daily operations of a medical store efficiently. In traditional medical stores, most activities such as maintaining medicine records, managing stock, and generating bills are done manually using registers. This manual process takes a lot of time and often leads to errors and difficulties in maintaining accurate records.

The main purpose of developing this software is to simplify the management of medical store operations. This system helps in storing medicine details, managing stock levels, generating bills, and maintaining records of customers and suppliers. By using this system, medical store owners can easily monitor the availability of medicines and track their expiry dates.

The software provides a user-friendly interface that allows users to enter, update, and retrieve data quickly. It also helps in generating various reports such as sales reports, stock reports, and purchase reports. These reports help the store owner make better decisions regarding inventory management.

The Medical Store Management Software reduces manual work and improves the accuracy of records. It also saves time and increases efficiency in managing the store operations. This system can be very useful for small and medium-sized medical stores.

DRAWBACKS OF MANUAL SYSTEM

In many medical stores, the management of medicines, billing, and stock records is done manually using paper registers. Although this method has been used for many years, it has several disadvantages and limitations.

One of the major drawbacks of the manual system is that it is **time-consuming**. Store employees need to write down every detail such as medicine name, quantity, price, and customer information manually. This process takes a lot of time, especially when the store is busy.

Another problem with the manual system is the **possibility of human errors**. Since calculations and data entries are done manually, there is a high chance of mistakes in billing, stock counting, and record maintenance. These errors can cause financial losses for the store.

The manual system also makes it **difficult to track medicine stock and expiry dates**. If a medicine expires and the store owner is not aware of it, it may lead to selling expired medicines, which is dangerous for customers.

Another major issue is **data storage and security**. Paper records can be lost, damaged, or misplaced easily. Searching for old records is also very difficult and time-consuming.

Due to these problems, it becomes necessary to develop a computerized system that can manage all medical store operations efficiently and accurately.

PROPOSED SYSTEM

The proposed system is a **Medical Store Management Software** designed to overcome the limitations of the manual system. This system uses computer technology to manage the records and operations of a medical store in an efficient and organized way.

The system allows the user to store and manage information about medicines, suppliers, customers, and sales transactions. All data is stored in a digital database, which makes it easy to retrieve and update information whenever required.

One of the main features of the proposed system is **inventory management**. The system automatically keeps track of the available stock of medicines and alerts the user when the stock is low. It also helps in tracking the expiry dates of medicines.

The system also provides a **billing feature**, which helps in generating bills quickly and accurately. This reduces calculation errors and saves time for both the store owner and the customer.

Another advantage of the proposed system is that it can generate **different types of reports**, such as daily sales reports, stock reports, and purchase reports. These reports help the store owner analyze business performance and make better decisions.

Overall, the proposed system makes medical store management more efficient, reliable, and user-friendly.

SCOPE OF PROPOSED SYSTEM

The scope of the **Medical Store Management Software** is to provide an efficient system for managing the daily activities of a medical store. The system is designed to automate various tasks such as maintaining medicine records, managing inventory, generating bills, and preparing reports.

One of the important scopes of the system is **inventory management**. The system helps in maintaining detailed information about medicines including their name, price, quantity, and expiry date. This helps the store owner to keep track of available stock and avoid shortages.

The system also helps in managing **supplier and customer information**. The store owner can store details of suppliers from whom medicines are purchased and maintain records of customers who buy medicines from the store.

Another important feature within the scope of the system is **billing management**. The software can generate bills quickly and accurately, which helps in improving customer service and reducing waiting time.

The system also provides **report generation features**. Reports such as sales reports, stock reports, and purchase reports help the store owner analyze the performance of the business and plan future activities.

In the future, the system can be expanded with additional features such as online ordering, barcode scanning, and mobile application support.

FEASIBILITY STUDY

A feasibility study is conducted to determine whether the proposed system is practical, beneficial, and possible to implement. It helps in analyzing the advantages, cost, and resources required for the development of the Medical Store Management Software. The feasibility study ensures that the system can be successfully implemented without major difficulties.

The feasibility study mainly includes three types:

Technical Feasibility:

Technical feasibility checks whether the required technology, software, and hardware are available to develop and run the system. In this project, technologies such as Node.js, Express.js, MySQL database, and web browsers are used. These technologies are widely available and easy to implement, making the project technically feasible.

Economic Feasibility:

Economic feasibility determines whether the cost of developing and maintaining the system is affordable. Since this system uses commonly available tools and technologies, the cost of development is relatively low. The system also reduces manual work, which saves time and operational costs.

Operational Feasibility:

Operational feasibility checks whether the system will work properly in a real environment. The proposed system has a user-friendly interface and simple operations, which makes it easy for medical store staff to use. Therefore, the system is operationally feasible.

Thus, the feasibility study shows that the Medical Store Management Software is practical and beneficial for medical stores.

HARDWARE AND SOFTWARE REQUIREMENTS

For the successful implementation of the Medical Store Management Software, certain hardware and software requirements are necessary. These requirements ensure that the system runs smoothly and efficiently.

Hardware Requirements:

- Computer or Laptop
- Minimum 4 GB RAM
- Hard Disk with sufficient storage
- Keyboard and Mouse
- Printer (for printing bills and reports)

The hardware used in this system should be capable of handling database operations and running the application efficiently.

Software Requirements:

- Operating System: Windows / Linux
- Programming Language: JavaScript
- Backend Technology: Node.js and Express.js
- Database: MySQL
- Frontend Technology: HTML, CSS, and EJS
- Web Browser: Google Chrome or any modern browser

These software tools help in developing a web-based system that allows users to access the application easily through a browser. The combination of these technologies makes the system reliable, efficient, and easy to maintain.

FACT FINDING TECHNIQUES

Fact finding techniques are methods used to gather information and understand the requirements of a system before developing it. These techniques help developers understand how the current system works and what improvements are needed.

Some commonly used fact finding techniques include:

Interviews:

Interviews involve asking questions directly to the medical store owner or staff. This helps in understanding their daily activities, problems faced in the manual system, and expectations from the new system.

Observation:

Observation involves watching how the medical store staff performs their tasks such as managing medicines, billing, and maintaining records. This helps developers understand the workflow of the store.

Questionnaires:

Questionnaires involve preparing a list of questions and asking users to provide answers. This technique helps collect information from multiple users easily.

Document Analysis:

This method involves studying existing documents such as bills, registers, stock records, and supplier details used in the manual system.

These techniques help in gathering accurate information which is useful in designing the Medical Store Management Software effectively.

DATA DICTIONARY

A data dictionary is a detailed description of all the data elements used in the database. It provides information about the tables, fields, data types, and relationships used in the system.

The data dictionary helps developers understand the structure of the database and how data is stored and accessed. It also helps maintain consistency in the database design.

Some important data fields used in the Medical Store Management Software include:

- **Medicine ID:** Unique identifier for each medicine
- **Medicine Name:** Name of the medicine
- **Price:** Cost of the medicine
- **Quantity:** Available stock quantity
- **Expiry Date:** Expiration date of the medicine
- **Supplier Name:** Name of the medicine supplier
- **Customer Name:** Name of the customer
- **Bill Number:** Unique number for each transaction

The data dictionary plays an important role in maintaining organized and structured data in the system.

TESTING STRATEGIES

Testing is an important part of software development. It ensures that the system works correctly and without errors.

Different types of testing used in the project include:

Unit Testing: Testing individual modules separately.

Integration Testing: Testing multiple modules together to ensure they work correctly.

System Testing: Testing the complete system to ensure it meets the requirements.

User Acceptance Testing: Testing performed by users to ensure the system works as expected.

Testing helps identify and fix errors before the system is used in real environments.

LIMITATIONS OF PROPOSED SYSTEM

Although the Medical Store Management Software provides many benefits, it also has some limitations.

The system requires basic computer knowledge to operate. Store staff who are not familiar with computers may require training.

The system also depends on proper hardware and software infrastructure. If the computer system fails, the application may temporarily stop functioning.

Data security is another important concern. Proper security measures must be implemented to protect sensitive information.

Despite these limitations, the system still provides significant advantages over manual methods.

CONCLUSION

The Medical Store Management Software is an efficient system designed to simplify the management of medical store operations. The system helps store owners maintain accurate records of medicines, customers, suppliers, and sales transactions.

By replacing the manual system with a computerized system, the software reduces human errors, saves time, and improves efficiency. It also provides various reports that help the store owner analyze business performance.

Overall, the system improves the productivity of the medical store and makes operations easier to manage.

FUTURE ENHANCEMENT

The Medical Store Management Software can be improved in the future by adding more advanced features.

Possible enhancements include:

- Online medicine ordering system
- Mobile application for store management
- Barcode scanning for medicines
- Automatic alerts for medicine expiry
- Integration with online payment systems

These features will make the system more powerful and convenient for users.

BIBLIOGRAPHY AND WEBLIOGRAPHY

The development of this project required studying various resources including books, websites, and online tutorials.

Books:

Software Engineering books and database management books were referred for understanding system development concepts.

Websites:

- Node.js official documentation
- MySQL documentation
- Web development tutorials and programming guides

These resources helped in understanding the technologies used in the development of the Medical Store Management Software.
